

Samhållighet is the Swedish term that encapsulating the essence of 'sustainability' and 'cohesiveness'.

How can we innovate the design and material composition of biodegradable bandages to not only enhance their effectiveness in wound care but also minimise environmental impact, contributing to create a model for environmentally conscious healthcare solutions that can be rapidly implemented and scaled up?

In response to the escalating demand for sustainable healthcare solutions, this material exploration project aims to revolutionise wound care by designing biodegradable bandages.

This project boldly explores the potential of employing more biodegradable materials, replacing the prevalent petroleum-based industrial plastics. Can this shift be the antidote to the environmental emergency, and when might we witness its widespread adoption?

This endeavour represents a forward-looking fusion of product design practices and speculative design logic. Through the synthesis and application of novel plastics, the project not only ponders these pressing questions but also aspires to propel speculative proposals and practices forward.
